Introduction

CD3 Stands for **C**loud **D**eployment **D**esign **D**eliverable and is a structured design-level representation of the customer's OCI future state solution. The CD3 Automation toolkit is a processor that converts the detailed OCI design spec in the form of excel sheet into executable Terraform code, or takes an export of customer tenancy objects and resources, and converts it back into a design spec.

The generated TF files can be re-used at any time to build a similar infrastructure.

Automation Toolkit for OCI

Below is the list of OCI services that the CD3 Automation Toolkit can be used for the generation of Terraform files.

Identity	Compartments, Groups, Dynamic Groups, Policies
Network	VCNs, Subnets, Route Tables, Security Lists, NSGs, NAT gateways, IGWs, Service Gateways, LPGs, DRG, DRG Distributions, DRG Route Tables, LBaaS, Network Load Balancers
Compute	Instances VM/BM
Storage	Boot Volumes, Block Volumes, FSS
Governance	Tag Namespaces, Tag Keys, Default Tags, Cost Tracking Tags, Defined Tags
Developer Services	Resource Manager
Databases	ADW/ATP, Exa-Infra, Exa - Clusters, DB VM/BM
Management Services	Events, Alarms, Notifications, Logging
CIS Features	CIS Report, OSS, KMS - Key, Vault, VCN Flow Logs and Object Storage Write Logs, Cloud Guard, Budget

Automation Toolkit Workflows

CD3 Automation Tool Kit supports 2 main workflows:

1. Greenfield Tenancies. - Empty OCI tenancy (or) do not need to modify / use any existing resources.
2. Non-Greenfield Tenancies - Need to use / manage existing resources. Export existing resources into CD3 & TF State, then use the Greenfield workflow.

To obtain access and keep abreast of the latest releases - please join the [#oci-cd3-champions](#) channel.

Check out the videos at <https://otube.oracle.com/channel/CD3%2BAutomation%2BToolkit/252278113> to learn and familiarise the toolkit before getting started.

Recommendations

- Use the **Validate** option in **SetUpOCI** menu to validate the syntax/typos in your input CD3 Excel sheet.
- For the Non-Greenfield Tenancies, please use a clean out directory (Make sure to not have any **.auto.tfvars** or **terraform.tfstate** in the outdir) and a blank CD3 file - **CD3-Blank-template.xlsx**.
- Prepping the out directory to support a newly subscribed region at a later point in time involves -

- **Taking a backup** of the **existing out directory**

- **Copying** all the terraform **modules** and **.tf** files, **except** the **.auto.tfvars** and **.tfstate** files from existing region

- **Modifying** the **name** of **variables file** (variables_<region>.tf)

- **Modifying** the **region parameter** in **variables_<region>.tf**

- Preparing the out directory to support a new docker image release or update involves -

- **Taking a backup** of the **existing out directory (Optional)**

- **Copying** all the terraform **modules** and **.tf** files (Except **variables_example.tf**) from **/cd3user/oci_tools/cd3_automation_toolkit/user-scripts/terraform/** to region specific directories in out directory.

Example:

```
cd /cd3user/oci_tools/cd3_automation_toolkit/user-scripts/terraform/  
cp -R modules /cd3user/tenancies/<customer_name>/terraform_files/<region>/  
cp *.tf /cd3user/tenancies/<customer_name>/terraform_files/<region>/  
cd /cd3user/tenancies/<customer_name>/terraform_files/<region>/  
rm -rf variables_example.tf
```

Pre-requisites

Tenancy Access Requirement: Appropriate IAM policies must be in place for each of the resources that the user may try to create. Minimum requirement for the user to get started is to have the ability to read to the tenancy.

Input: CD3 Excel Sheet (Sample CD3 templates here: [Example CD3 Excel Templates - CIS Landing Zone](#))

Out Directory: A directory that will be shared with the docker container that will hold the generated Terraform files.

Docker Image: Join the Slack Channel [#oci-cd3-champions](#) for information on the latest releases & the Docker Image URL.

Platform used to run the toolkit: Docker Container (Linux). Steps to install Rancher Desktop/Podman can be found at - [Install Rancher or Podman](#)

Deploy

Do **NOT** be connected to **Oracle VPN** while performing the steps.

Import the docker image

On receiving the Object Storage URL for the Docker Image, download and move the `cd3toolkit_<version_number>.tar.gz` to the system where the Rancher Desktop/podman is installed.

Create a directory in your local machine. This will be the output directory while running the toolkit to store the generated Terraform/other files.

Place any files or folder in this path to make it available inside the container. This directory will be mapped to a docker container directory and the path to this directory is identified as **<path_in_local_system_where_the_files_must_be_generated>** in the next steps.

This will allow you to upgrade the docker container in the future without losing your data.

Steps	Rancher Desktop (with Docker CLI)	Podman
Load the docker image	<pre>sudo docker load < cd3toolkit_<version number>.tar.gz</pre> <p>Example:</p> <p>(Example for Linux: <code>sudo docker load < cd3toolkit_v5.0.tar.gz</code>)</p> <p>(Example for Windows: <code>docker load -i cd3toolkit_v5.0.tar.gz</code>)</p>	<pre>sudo podman load < cd3toolkit_<version number>.tar.gz</pre> <p>Example:</p> <p>(Example for Linux: <code>sudo podman load < cd3toolkit_v5.0.tar.gz</code>)</p> <p>(Example for Windows: <code>podman load -i cd3toolkit_v5.0.tar.gz</code>)</p>
List the docker images	<pre>sudo docker images</pre>	<pre>sudo podman images</pre>
Create the container	<pre>sudo docker run -it -d -v \<path_in_local_system_where_the_files_must_be_generated>:/cd3user/tenancies \<image_name>:<version_number> /sbin/init</pre> <p>The arguments <code>-v <path_in_local_system_where_the_files_must_be_generated></code> in the above command is used to map the local directory to a docker container directory <code>/cd3user/tenancies</code>).</p> <p>(Example for Linux: <code>sudo docker run -it -d -v /home/opc/tenancies:/cd3user/tenancies localhost/cd3toolkit:v5.0 /sbin/init</code>)</p> <p>(Example for Windows: <code>docker run -it -d -v D:\tenancies:/cd3user/tenancies localhost/cd3toolkit:v5.0 /sbin/init</code>)</p>	<pre>sudo podman run -it -d -v \<path_in_local_server_where_the_files_must_be_generated>:/cd3user/tenancies \<image_name>:<version_number> /sbin/init</pre> <p>The arguments <code>-v <path_in_local_server_where_the_files_must_be_generated></code> in the above command is used to map the local directory to a docker container directory <code>/cd3user/tenancies</code>).</p> <p>(Example for Linux: <code>sudo podman run -it -d -v /home/opc/tenancies:/cd3user/tenancies localhost/cd3toolkit:v5.0 /sbin/init</code>)</p> <p>(Example for Windows: <code>podman run -it -d -v D:\tenancies:/cd3user/tenancies localhost/cd3toolkit:v5.0 /sbin/init</code>)</p> <p>(Example for MacOS: <code>podman run -it -d -v <podman_vm_path>:/cd3user/tenancies localhost/cd3toolkit:v5.0 /sbin/init</code> -Replace <code>podman_vm_path</code> with the one that was used during podman init)</p>
List the running containers and note the container id	<pre>sudo docker ps</pre>	<pre>sudo podman ps</pre>
Exec into the docker container	<pre>sudo docker exec -it <container_id> bash</pre>	<pre>sudo podman exec -it <container_id> bash</pre>

Configuring the Docker Container to connect to OCI Tenancy

Follow the below steps to configure the docker container to connect to a tenancy:

Repeat this process for every new customer. Same docker container can be connected to multiple OCI tenancies.

Commands to execute inside the container:

Steps	Command
Change Directory to that of user-scripts	<pre>cd /cd3user/oci_tools/cd3_automation_toolkit/user-scripts/</pre>
API PEM keys: If the key pair does not exist, create them using the script.	<pre>python /cd3user/oci_tools/cd3_automation_toolkit/user-scripts/createAPIKey.py</pre> <p>In case you already have the keys, rename the private key file to oci_api_private.pem and place it at /cd3user functioning.</p>
Upload the Public key to "API keys" under user settings in OCI Console.	<p>Pre-requisite to use the complete functionality of the Automation Toolkit is to have the user as an administrator</p> <p>Steps:</p> <ol style="list-style-type: none">1. Open the Console, and sign in as the user: View the details for the user who will be calling the API with the key pair:2. Open the Profile menu (User menu icon) and click User Settings.3. Click Add Public Key.4. Paste the contents of the PEM public key in the dialog box and click Add.
Enter the details to tenancyconfig.properties file	<pre>tenancyconfig.properties</pre> <pre>[Default] #Mandatory Fields #Friendly name for the Customer Tenancy eg: gctenancy; #The generated .auto.tfvars will be prefixed with this customer name customer_name= tenancy_ocid= fingerprint= user_ocid= #Path of API Private Key (PEM Key) File; If the PEM keys were generated by runni field empty. #Defaults to /cd3user/tenancies/keys/oci_api_private.pem when left empty. key_path= #Region ; defaults to us-ashburn-1 when left empty. region= #Optional Fields #SSH Key to launched instances ssh_public_key=</pre>
Initialise your environment to use the Automation Toolkit	<pre>python /cd3user/oci_tools/cd3_automation_toolkit/user-scripts/createTenancyConfi properties</pre> <p>If the API Keys were generated and added to the OCI console using the previous steps, it might take a couple above command immediately might result in Authentication Errors. In such cases, please retry after a minute.</p>

ERROR: While executing the above steps on a Linux VM in OCI - If the outdir is on the root, you may get a permission denied error. In such scenarios, please

- **Error Screenshot**

```
[opc@shrsupra-linux ~]$ sudo docker run -it -d -v /var/tmp/docker-container:/cd3user/tenancies/ localhost/cd3toolkit:v5.0.2 /sbin/init

```

- Alternately, please attach a **data disk** and map the container (/cd3user/tenancies) on a folder that is created on the data disk (your local folder)

Files created on successfully completing the above steps -

1. A customer specific Config file
2. Customer specific setUpOCI.properties file
3. Region based directories along with Variables File, Provider File, Root and Sub modules
4. Public and Private Key Pairs
5. cmds.log file that contains a copy of the [Commands to execute](#) section of the [console output](#)
6. A documentation directory with two sub directories containing .pdf and .md files providing instructions on how to use the toolkit and edit the .auto.tfvars

Description of the Generated files:

Files Generated	At File Path	Comment/Purpose
Config File	/cd3user/tenancies/<customer_name>/<customer_name>_config	Customer specific Config file is required for OCI API calls.
setUpOCI.properties	/cd3user/tenancies/<customer_name>/<customer_name>_setUpOCI.properties	Customer Specific properties files will be created.
Region based directories	/cd3user/tenancies/<customer_name>/terraform_files	Tenancy's subscribed regions based directories for the generation and segregation of terraform files.
Variables File, Provider File, Root and Sub modules	/cd3user/tenancies/<customer_name>/terraform_files/<region>	Required for terraform to work.
Public and Private Key Pairs	Copied from /cd3user/tenancies/keys/ to /cd3user/tenancies/<customer_name>/	API Keys that were previously generated are moved to customer specific out directory locations for easy access.
A log file with the commands to execute	/cd3user/tenancies/<customer_name>/cmds.log	This file contains a copy of the Commands to execute section of the console output .
Documentation folder	/cd3user/tenancies/<customer_name>/documentation/user_guide/ /cd3user/tenancies/<customer_name>/documentation/terraform/	These folders contain the PDF and .md files with instructions on how to use the toolkit and edit the .auto.tfvars .

Running the Automation Toolkit

Complete the execution of the above scripts. Next, Choose the appropriate CD3 Excel Sheet from below and update the setUpOCI.properties file at /cd3user/tenancies/<customer_name>/<customer_name>_setUpOCI.properties. Finally, run the commands displayed in the console output. These commands are also made available in the cmds.log file of the output directory for future reference.

Excel Sheet Templates - CIS Landing Zone

Below are the CD3 templates for the latest release having standardised IAM Components (compartments, groups and policies), Network Components and Events & Notifications Rules as per [CIS Landing Zone](#) and the [CIS Foundations Benchmark for Oracle Cloud](#).

Details on how to fill the data into the excel sheet can be found in the Blue section of each sheet inside the excel file. Please refer [CD3 Excel Information](#) for additional details on each tab of the excel sheets.

Excel Sheet	Purpose
CD3-Blank-template.xlsx	Choose this template while exporting the existing resources to the CD3 and Terraform.
CD3-CIS-template.xlsx	This template has auto-filled in data of CIS Landing Zone. Choose this template while using a tenancy that supports DRGV2.
CD3-HubSpoke-template.xlsx	This template has auto-filled in data for a Hub and Spoke model of networking. The user must only modify the region according to requirement and execute the toolkit to generate the terraform files.
CD3-CIS-ManagementServices-template.xlsx	This template has auto-filled in data of CIS Landing Zone. Choose this template while creating the components of Events, Alarms and Notifications.
CD3-SingleVCN-template.xlsx	This template has auto-filled in data for a Single VCN model of networking. The user must only modify the region according to requirement and execute the toolkit to generate the terraform files.

Here is the CIS Landing Zone quick start template by NACE Security Team also:

<https://www.ateam-oracle.com/cis-oci-landing-zone-quickstart-template>

setUpOCI.properties

Before we start with the steps to execute the Automation Toolkit, kindly update the properties file which is the input to the Toolkit.

Current Version: setUpOCI.properties v9.2

Example File: (This file can be found at /cd3user/oci_tools/cd3_automation_toolkit/. Make sure to use/modify the properties file at /cd3user/tenancies/<customer_name>/<customer_name>_setUpOCI.properties during executions)

[Default]

#Input variables required to run setUpOCI script

#path to output directory where terraform file will be generated. eg /cd3user/tenancies/<customer_tenancy_name>/terraform_files when running from cd3toolkit docker container

outdir=/cd3user/tenancies/demotenancy/terraform_files

#prefix for output terraform files eg client name

prefix=demotenancy

#input config file for Python API communication with OCI eg example\config; Leave it blank if code is being executed from OCS Work VM

config_file=

#params required if input data format is cd3

#path to cd3 excel eg example\CD3-template.xlsx

cd3file=/cd3user/tenancies/demotenancy/CD3-demotenancy-template.xlsx

#Is it a Non Green Field tenancy

non_gf_tenancy=false

Variable	Description	Example
outdir	Path to output directory where terraform files will be generated	Pycharm: D:\oci_tenancy\SetUpOCI_Via_TF\terraform_files OR Docker Container: /cd3user/tenancies/<customer_name>/terraform_files
prefix	Prefix for output terraform files	<customer_name>
config_file	Python config file	Pycharm: D:\oci_tenancy\SetUpOCI_Via_TF\config OR Docker Container: /cd3user/tenancies/<customer_name>/config
Below variables to be filled if the input format is CD3		
cd3file	Path to the CD3 input file	Pycharm: D:\oci_tenancy\SetUpOCI_Via_TF\testCD3.xlsx OR Docker Container: /cd3user/tenancies/<customer_name>/testCD3.xlsx
non_gf_tenancy	Specify if its a Non Green field tenancy or not (True or False)	False

Execution Steps:

Steps	Command
Change Directory to that of SetUpOCI	<pre>cd /cd3user/oci_tools/cd3_automation_toolkit/</pre>
Edit the setUpOCI.properties at location <i>/cd3user/tenancies/<customer_name>/<customer_name>_setUpOCI.properties</i> with appropriate values.	Place Excel sheet at appropriate location in your docker and provide the corresponding path in <i>/cd3user/tenancies/<customer_name>/<customer_name>_setUpOCI.properties</i> file
Execute the SetUpOCI Script	<pre>python setUpOCI.py /cd3user/tenancies/<customer_name>/<customer_name>_setUpOCI.properties</pre>

Additional Command:

Execute the command to fetch the details of the compartments if it is already exists/created in OCI.

These details will be written to the terraform variables file.

```
python fetch_compartments_to_variablesTF.py /cd3user/tenancies
/<customer_name>/terraform_files --config /cd3user/tenancies
/<customer_name>/<customer_name>_config
```

Choose the right option by setting the property **non_gf_tenancy** of **setUpOCI.properties** , to toggle between the two workflows:

1. Set the property **non_gf_tenancy** to **false** for supporting **Green Field Tenancies**

this will help to **create** new resources

2. Set the property **non_gf_tenancy** to **true** for supporting **Non - Green Field Tenancies**

this will help to **export** existing resources **from OCI to CD3**,
create the terraform configuration files for them and
a shell script containing the import commands to import the state of exported components to the tfstate file.

Once the export (including the execution of **tf_import_commands_<resource>_nonGF.sh**) is complete, switch the value of **non_gf_tenancy** back to **false**. This allows the Tool Kit to support the tenancy as Green Field from this point onwards.

Steps to execute Automation Toolkit Workflows

Green Field Tenancies

Below are the steps that will help to configure the Automation Tool Kit to support the Green Field Tenancies:

Step 1: The CD3 Template can be found at location - /cd3user/oci_tools/cd3_automation_toolkit/example or can be downloaded from [cd3](#)

For the Core OCI Objects (IAM, Tags, Networking, Instances, LBR, Storage, Databases) - use the **CD3-SingleVCN-template.xlsx** file or **CD3-HubSpoke-template.xlsx** or **CD3-DRGv2-template.xlsx** based on the requirement.

For Events, Notifications and Alarms- use the **CD3-ManagementServices-template.xlsx** file.

Step 2: Fill the CD3 file with appropriate values specific to the client and put at the appropriate location.

Modify/Review **setUpOCI.properties**: (**non_gf_tenancy** set to **false**)

```
1 [Default]
2
3 #Input variables required to run setUpOCI script
4
5 #path to output directory where terraform file will be generated. eg /cd3user/tenancies/<customer_name>/terraform_files when running from OCS VM
6 outdir=/cd3user/tenancies/demotenancy/terraform_files
7
8 #prefix for output terraform files eg client name
9 prefix=demotenancy
10
11 #input config file for Python API communication with OCI eg example\config; Leave it blank if code is being executed from OCS Work VM
12 config_file=
13
14 #params required if input data format is cd3
15 #path to cd3 excel eg example\CD3-template.xlsx
16 cd3file=/cd3user/tenancies/demotenancy/CD3-demotenancy-template.xlsx
17
18 #Is it Non GreenField tenancy
19 non_gf_tenancy=false
20
```

Step 3: Execute the SetUpOCI.py script to start creating the terraform configuration files.

Command to Execute:

python setUpOCI.py <path_to_setUpOCI.properties>

Example execution of the wrapper script:

```

0. Validate CD3
1. Identity
2. Tags
3. Network
4. Compute
5. Storage
6. Database
7. Load Balancers
8. Management Services
9. Developer Services
10. Enable OCI CIS Compliant Features (Key/Vault, OSS, Budget, Cloud-Guard, VCN Flow Logs)
q. Press q to quit

```

See example folder for sample input files

Enter your choice (specify comma separated to choose multiple choices): *0,1,2*

Choose the resources by specifying a single option (for choosing one of these resources) or comma-separated values (to choose multiple resources) as shown in the sample screenshot above.

Note: Make sure to execute ***fetch_compartments_to_variablesTF.py*** after you create Compartments, this will ensure that the variables file in *outdir* is updated with the information of all the compartments.

Command to execute in docker container: `python fetch_compartments_to_variablesTF.py <outdir> --config <path_to_configfile>`

Non-Green Field Tenancies

Note:

1. Course of actions involved in Exporting objects from OCI -

- Automation Tool Kit fetches the data for the cd3 supported services from all the regions the tenancy is subscribed to. Data is written to appropriate sheets of the CD3 based on the resources being exported.
- Tool Kit then generates the TF configuration files/auto.tfvars files for these exported resources.
- It also generates a shell script - ***tf_import_commands_<resource>_nonGF.sh*** that has the import commands, to import the state of the resources to tfstate file (This helps to manage the resources via Terraform in future).

Below are the steps that will help to configure the Automation Tool Kit to support the Non - Green Field Tenancies:

Step 1: Choose the right CD3 format for exporting the contents from OCI.

Two different formats of CD3 to be used : (An example of these files can be found at location - /cd3user/oci_tools/cd3_automation_toolkit/example or can be downloaded from [cd3](#))

CD3-Blank.xlsx - Use this format of the Excel sheet to export objects like Network Components, Identity Components, Core Infra Components , DB Components and Tags.

CD3-CIS-ManagementServices-template.xlsx - Use this format of the Excel sheet to export Events, Notifications and Alarms.

Step 2: Fill up/review the **setUpOCI.properties** file.

Once the CD3 format is chosen, fill the sheets with appropriate values and put it at the appropriate location.

Modify **setUpOCI.properties** as shown below: (**non_gf_tenancy** set to **true**)

```

1 [Default]
2
3 #Input variables required to run setUpOCI script
4
5 #path to output directory where terraform file will be generated. eg /cd3user/tenancies/<customer_name>/terraform_files when running fi
6 outdir=/cd3user/tenancies/demotenancy/terraform_files
7
8 #prefix for output terraform files eg client name
9 prefix=demotenancy
10
11 #input config file for Python API communication with OCI eg example\config; Leave it blank if code is being executed from OCS Work VM
12 config_file=
13
14 #params required if input data format is cd3
15 #path to cd3 excel eg example\CD3-template.xlsx
16 cd3file=/cd3user/tenancies/demotenancy/CD3-demotenancy-template.xlsx
17
18 #Is it Non GreenField tenancy
19 non_gf_tenancy=true
20

```

Step 3: Execute the SetUpOCI.py script to start exporting the resources to CD3 and creating the terraform configuration files.

Command to Execute:

`python setUpOCI.py <path_to_setupOCI.properties>`

Example execution of the wrapper script:

```

non_gf_tenancy in properties files is set to true..Export existing OCI objects and Synch with TF state
Process will fetch objects from OCI in the specified compartment from all regions tenancy is subscribed t

1. Export Identity
2. Export Tags
3. Export Network
4. Export Compute

q. Press q to quit
Enter your choice (specify comma separated to choose multiple choices): 1,2,3

```

Choose the resources by specifying a single option (for choosing one of these resources) or comma-separated values (to choose multiple resources) as shown in the sample screenshot above.

Each of these will execute **`fetch_compartments_to_variablesTF.py`** automatically, to write compartment info to the variables file in the region's respective *outdir* and update the input *cd3file* with data exported from OCI.

Tabs- Exported OCI data will over-write to the specific CD3 sheets while the other sheets remain intact.

Expected Outputs:

- Excel sheet with the resource details from OCI
- Terraform Configuration files - *.auto.tfvars
- Shell Script with import commands - `tf_import_commands_<resource>_nonGF.sh`

Action: Execute the `tf_import_commands_<resource>_nonGF.sh` files that are generated in the *outdir*.

The terraform plan should show that infrastructure is up-to-date with no changes required for all regions.

```
Refreshing Terraform state in-memory prior to plan...
The refreshed state will be used to calculate this plan, but will not be
persisted to local or remote state storage.

-----

No changes. Infrastructure is up-to-date.

This means that Terraform did not detect any differences between your
configuration and real physical resources that exist. As a result, no
actions need to be performed.
```

Support for additional attributes

To support additional attributes -

Add the attribute name to the CD3 Excel sheet (based on the resource the attribute belongs to) as given in Terraform Official Documentation.

To add Freeform Tags -

Automation Tool Kit allows the tagging of resources. To use this option, the user is required to add the below column to the appropriate CD3 sheet.

Ex: To Tag your Instances, Open the 'Instances' sheet of your CD3 and add the below column at the end.

- FreeForm Tags

Note

The Tag Values (Default and Freeform Tags) specified will apply to all the resources in the tab.

Ex: The tags applied to VCNs will not be applied to its objects like IGW, NGW, SGW, LPG, etc

Empty column values are allowed for FreeForm and Defined Tags; when used it does not attach any tags to the resource. eg: Row 1 in the below example

Semi Colon is used as Delimiter between multiple tag values (Example as shown below)

Allowed Values for Tags include the following formats: (**Semi-colon** delimited values to be entered)

Example:

SNo	FreeForm Tags	Defined Tags
1		
2	Network=Test1;Network2=Test40	Operations.CostCenter=01;Users.Name=user01
3	Network=Test2; Network2=Test4	Application.Env=Dev
4	Network=	OS.Version=
5	testing	Platform.Usage

Export of new attributes is only supported if the attribute name of Terraform documentation matches that of the Python SDK. Export may fail to fetch the data incase there is a mismatch of the variable names.

Incase of inappropriate results while adding additional attributes or exporting the same, please contact -

- Suruchi Singla <suruchi.singla@oracle.com>
- Shruthi Subramanian <shruthi.subramanian@oracle.com>

Output

Terraform Modules/Flat files.
